The invention relates to an Oncorhynchus mykiss somatostatin polypeptide containing a portion of preprosomatostatin I (PPSS-I) and/or a portion of preprosomatostatin I (PPSS-II). The protein sequences and their associated polynucleotides are useful for identifying modified associated polynucleotides are useful for identifying modified somatostatin polypeptide which functions as somatostatin agonist useful cor research, therapeutics or diagnostics, including medical and veterinary applications. The wild-type somatostatin and its modified the pitultary (e.g. acromagaly) or gastroenteropancratic tissues (e.g. gastrinoma, glucagonoma, carcinoid syndrome), to cause tumours hinthy their effects on cell prolliferation and apoptosis and as adjuncts in the treatment of diabetes mellitus via inhibition of growth hormone and glucagon. In addition, dysfunctional somatostatin secretion is associated with acquired immunodeficiency syndrome (AIDS) and various neurological disorders (e.g. epilepsy, Alzheimer's disease and treatment of such conditions. Nucleic acids encoding the polypeptides are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an Oncorhynchus mykiss somatostatin polypeptide containing a portion of preprosomatostatin I (PPSS-I) and/or a portion of preprosomatostatin I (PPSS-I) and/or a portion of preprosomatostatin I (PPSS-I) and or a portion of preprosomatostatin I (PPSS-II). The protein sequences and their associated polynucleotides are useful for identifying modified of contact the polypeptide which functions as a somatostatin agonist useful for research, therepeutics or diagnostics, including medical and version are useful for the wild-type somatostatin and its modified version are useful for treating hypersecretion from endocrine tumours in attributery (e.g. acromegaly) or gastroenteropanceatic tisques (e.g. through their effects on cell proliferation and apoptosis and as adjuncts in the treatment of diabetes mellitus via inhibition of growth hormone and glucagon. In addition, dysfunctional somatostatin secretion is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and glucagon. In addition, dysfunctional somatostatin secretion is associated with acquired immunodeficiency syndrome (AIDS) and various neurological disorders (e.g. epilepsy, Alzhehmer's disease and Huntington's disease) and somatostatin antagonists are effective in the treatment of such condutions. Nucleic acids encoding the polypeptides are useful in gene therapy and fusion peptides can be targeted to neoplasms and their metastases, inhibiting the release of their secretory products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and uneir metastases, inhibiting the release of their secretory proditions are sequence represents 0. Mykiss ppsS-II'' protein.

Note: The features for this sequence are specifically claimed in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 MRVSQIHCALALLGLALAICSQGAASQPDLDLASRRLLQRALAAALPHRSGVSERWRTFY 60

The invention relates to an Oncorhynchus mykiss somatostatin polypeptide containing a portion of preprosomatostatin I (PPSS-II) and/or a portion of preprosomatostatin II (PPSS-II); The protein sequences and their associated polynuclectides are useful for identifying modified somatostatin polypeptide which functions as a somatostatin agonist useful for research, therapeutics or diagnostics, including medical and version are useful for treating hypersecretion from endocrine tumours in the pituitary (e.g. acromegaly) or gastroenteropanceatic tissues (e.g. through their effects on cell proliferation and apoptosis and as adjuncts and glucagonoma, carcinoid syndrome), to cause tumour shrinkage through their effects on cell proliferation and apoptosis and as adjuncts and glucagon. In addition, dysfunctional somatostatin secretion is associated with acquired immunodeficiency syndrome (AIDS) and various neurological disorders (e.g. epilepsy, Alzheimer's disease and managonists are effective in the treatment of such conditions. Nucleic acids encoding the polypeptides are and their metastases, inhibiting the release of their secretory products. This sequence is managonists are effective their secretory products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        expressed sequence tag; secreted protein; cDNA isolation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30
                                                                                                                                                                                                                                                                                                                                                                                                                                                     ence represents O. Mykiss PPSS-I protein.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     quantitating a polypeptide in tissue, as molecular weight markers and as
different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are larved from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene theorepy and crhromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.

imaging of sites expessing (II). (I) and (II) are useful for treating disorders involving aberant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensizes, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess blodiversity amino acid sequences. ABGO0010-ABG3037, represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the vipo int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Angiotensin converting enzyme splice variant; ACEV; interleukin 6; granulocyte colony stimulating factor receptor; glucagon; hypertrophy; platelet-derived endothelial cell growth factor; cardiovascular disease; cellular tumour antigen P53; cyclin-dependent kinase inhibitor 1C; wasoactive intestinal polypeptide receptor 2; arterioscierosis; cancer; mayocadial infarction; coronary arterial thrombosis; renal disease; diabetic nephropathy; muscular disease; immune disorder; sarcoidosis; nmultiple sclerosis; immune complex nephritis; deep vein thrombosis; nonarcoidotic pulmonary granulomatous disease; endothelial abnormality;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel alternative splicing variants e.g. variant of angiotensin converting enzyme (ACEV), useful in identifying candidate compounds capable of binding to the variant and to detect anti-variant antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               q
                                                                                                                                                       of
                                                                                    cyclin-dependent kinase
                                                                                                                        polypeptide receptor 2. The polypeptides and their associated nucleic acids are useful for identification of variant sequences and detection candidate compounds capable of binding the molecules. The sequences of the invention can be used in the treatment and diagnosis of various disorders including cardiovascular diseases such as arteriosclerosis, myocardial infarction and coronary arterial thrombosis, renal diseases such as diabetic nephropathy, muscular diseases such as hypertrophy, immune disorders such as immune complex nephritis, multiple sclerosis,

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      s and antagonists) that bind to them. Cells useful for identifying a therapeutic agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            s and antibodies to the polypeptides are useful for
the presence of or predisposition to a disease associated
a levels of polypeptide. The polypeptides are also useful d
                                                                                                                              and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes propeptides and therefore treat P. acnes infections. The antibodies may also be used diagnostic agents for determining P. acnes presence, for example, by Note: The sequence data for this patent did not form part of the prin specification, but was obtained in electronic format directly from WI

                                       the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase steem cell proliferation; to regulate heamatopolesis, and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or simulation, as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ed from human

probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human brain expressed single exon probe encoded protein SEQ ID NO: 35766.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Single exon nucleic acid probes for analyzing gene expression in human

ant invention relates to human single exon nucleic acid probes es AA110068-AA128459). The present sequence is a peptide encoded or probe. The SENPs are derived from human HeLa cella. The SENPs ed to produce a single exon microarray, which can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide #10620 encoded by probe for measuring placental gene expression.

```
The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for producting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 2, Al

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an Oncorhynchus mykiss somatostatin polypeptide containing a portion of preprosomatostatin (PPSS-11) and/or a portion of preprosomatostatin (PPSS-11) and/or a portion of preprosomatostatin and their associated polynuclectides are useful for identifying modified sometostatin polypeptide which functions as somatostatin agonist useful for research, therapeutics or diagnostics, including medical and verteinary applications: The wild-type somatostatin and its modified verteinary applications in wild-type somatostatin and its modified verteinary applications. The wild-type somatostatin and its modified the pituitary (e.g. acromagaly) or gastroenteropancreatic tissues (e.g. gastrinoma, glucagonoma, carcinoloid syndrome), to cause tumour shrinkage through their effects on cell proliferation and apoptosis and as adjuncts and glucagon. In addition, dysfunctional somatostatin secretion; and glucagon in addition, dysfunctional somatostatin secretion. Is associated with acquired immunodeficiency syndrome (ADS) and various neurological disorders (e.g. epilepsy, Alzhelmer's disease and their metastases) and somatostatin attagonists are effective in the treatment of such conditions. Nucleic acids encoding the polypeptides are useful in gene therapy and fusion peptides can be targeted to neoplasms and their metastases, inhibiting the release of their sequence represents O. Wakiss pressor of their secretory products. Note the sequence represents O. Wakiss pressor of their secretory products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rainbow trout; somatostatin; preprosomatostatin; hypersecretion; PPSS-I; PPSS-II'; PPSS-II'; andocrine tumnour; plutiary a jauda; aptocapomei; AIDS, astricenteropeancreatic tissue; acromegaly; gastrinoma; diabetes mellitus; carcinoid syndrome; cell proliferation; apoptosis; growth hormone;

The invention relates to an Oncorhynchus mykiss somatostatin polypeptide containing a portion of preprosomatostatin [PESS-ID] and/or a portion of preprosomatostatin and of preprosomatostatin and portion of preprosomatostatin and polypeptide which functions as a somatostatin agonist useful comparability of preprosoration applications. The wild type somatostatin and applications. The wild type somatostatin and its modified for research, therapeutics or diagnostics, including medical and control of the pitultary (e.g. acromegaly) or gastroenteropancreatic tissues (e.g. gastrinoma; alucagon as cardinoid syndrome,), to cause tumour shrinkage of plucagon. In addition, dysfunctional somatostatin secretion is and glucagon. In addition, dysfunctional somatostatin secretion is neurological disorders (e.g. epilepsy, Alzheimer's disease and Huntington's disease) and somatostatin antagonists are effective in the treatment of such conditions. Nucleic acids encoding the polypeptides are treatment of such conditions. Nucleic acids encoding the polypeptides are custul, in gene therapy and fusion peptides can be targeted to neoplasms or understases, inhibiting the release of their secretory products. This sequence represents O Mykiss PPSS-II (protein.
neurological disorder; HIV;
        glucagon; acquired immunodeficiency syndrome; neurological disorder; HIV epilepsy, Alzheimer's disease; Huntington's disease; neuroprotective; neoplasm; metastasis; gene theriapy; antidiabetic; nootropic; cytostatic; anti-human immunodeficiency Virus; osteopathic; anticonvulsant.

in the treatment of diabetes mellitus via inhibition of growth hormone and glucagon. In addition, dysfunctional somatostatin secretion is associated with acquired immunodeficiency syndrome (ALDS) and various neurological disorders (e.g. epilepsy, Alzheimer's disease and Huntington's disease) and somatostatin antagonists are effective in the treatment of such conditions. Nucleic acids encoding the polypeptides are useful in gene therapy and fusion peptides can be targeted to neoplasms and their metastases, inhibiting the release of their secretory products. This sequence represents 0. Mykiss PPSS-I protein.

Note: The features for this sequence are specifically claimed in the specification.
                                                                                                                                                                                                                                                                                                                                                                          ö
the pituitary (e.g. acromegaly) or gastroenteropancreatic tissues (e.g. gastrinoms, glucagonoma, carcinold syndrome), to cause tumour shrinkage through their effects on cell proliferation and apoptosis and as adjuncts in the treatment of diabetes mellitus via inhibition of growth hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents the wild type human enolase (NSE) protein. The primers represented by AAT60282-7660285 were used to amplify tyrosine introduced versions of this sequence. The introduced tyrosine residues combine a radioisotope in such a way as to have no substantial effect on the antigencity of the protein. The peptides with the introduced tyrosine residue are prepared by expressing a recombinant DNA sequence, where the tyrosine residue has been introduced via an insertion or substitution into the wild type sequence. The peptides can then be used in radioimmunoassays, as the introduction of the label does not alter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PCR; polymerase chain reaction; primer; amplify; tyrosine; human; NSE; enolase; radioisotope; antigen.

The present invention relates to compositions and methods for the detection, diagnosis and therapy of haemaclogical malignancies. The present sequence is the protein sequence of a human haematological malignancy related antiden. The methods of the present invention comprise melognancy related antiden. The methods of the present invention comprise detecting the presence of hematological malignancy related antique(s) in polypeptide, compared to an unaffected individual, is indicative of an increased risk; Haematological malignancies which can be treated using the present invention are chronic lymphocytic leukacmia, lymphoma, tolicular lymphoma, Hodgkin's lymphoma, non-Hodgkin's lymphoma and T/B
                                                                                                                                                                                                                                                                                     haematological malignancy; antigen; chronic lymphocytic leukaem

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides the protein, cDNA and genomic sequences of a human enolase 3 (beta, muscle) isogene containing a number of single nucleotide polymorphisms (SNPs). The sequences can be used to identify the haplotype of an individual and identify whether particular haplotypes are linked to certain diseases. The present sequence is the ENO3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; enolase 3(beta, muscle); ENO3; single nucleotide polymorphism; SNP; haplotype analysis; isogene.

The present invention relates to compositions and methods for the detection, diagnosis and therapy of haematological malignancies. The present sequence of a human haematological malignancy related antigen. The methods of the present invention comprise detecting the presence of haematological malignancy related antigen. The methods of the present of the presence of haematological malignancy related antigen(s) in polypeptide, compared to an unaffected individual, is indicative of an increased risk). Haematological malignancies which can be treated using the present invention are chronic lymphocytic leukaemia, lymphoma, follicular lymphoma, Hodgkin's lymphoma, non-Hodgkin's lymphoma and T/B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Compositions and methods for the detection of hematological malignancies, e.g. chronic lymphocytic leukemia, lymphoma, follicular lymphoma and Hodgkin's and T/B cell non-Hodgkin's lymphoma.

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397,
which represent the human ORFX open reading frames 1 to 3161. The ORFX
sequences have activities such as: cytostatic; hepatotropic; vulnerary;
antipacriatic; anticonvulsant; antiarthritic; immunosuppressant;
immunostimulant; cardiant; thrombolytic; coaquiant; vasotropic;
antidiabetic; hypotensive; dermatchlogical; immunosuppressive;
antidiahetic; hypotensive; dermatchlogical; immunosuppressive;
antidificialmantory; antibacterial; antivital; antifinantic;
antidificialmantory; antibacterial; antivital; antifinantic;
antidificialmantory; antibacterial; antivital; antifinantic;
antidificialmantory; antibacterial; antivital;
antidificialmantory; antibacterial; antivital;
antidificialmantory; manufacterial; antivital;
antidificialmantory; antibacterial; antivital;
antidificialmantory; antibacterial; antivital or treating
pathological conditions associated with an ORFX associated disorder. The
nucleic acids can be used to express ORFX proteins in gene therapy
vectors. The proteins and nucleic acids may be used to treat cancers;
correctors. The proteins and nucleic acids may be used to treat cancers;
antidiated disorders, neurodegenerative disorders, osteoarthritis;
and the acidical acidic

modified expression in fetal heart tissue as compared to adult heart tissue and the encoded proteins (ABB57375.ABB57392). The genes have cardiant activity and may be useful in the promotion of the repair of damage to heart tissue caused by myocardial necrosis. The gene sequences are useful for screening potential compounds for the ability to influence disease associated with myocardial necrosis. Drugs identified by the screening methods may be used to treat and prevent disease with which myocardial necrosis is associated, such as cardiac hypertrophy and cardiac insufficiency. Diagnosis of diseases such as those above is also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope.
                                                                                                                                                                                                                                                                                                                                                                                              Genes having differential expression in fetal and adult heart tissue useful for screening potential drugs for promoting repair of damage caused by myocardial necrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                invention relates to gene sequences (ABI99915-ABI99934) having

The invention relates to 1 of 232 isolated or recombinant polynuclectides encoding an Arabidopsis thaliana transcription factor, their variants, complements, fragments, or related polynuclectide with 31% to 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered phenotype as compared to a wild-type or reference plant, or the plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               An isolated or recombinant polynucleotide used to produce a transgenic plant -
  in signal transduction after ligand binding. These NGPCR's are expressed in human placenta, bone marrow, trachea, testis, liver and kidney cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Keddie

                                                                                                                   AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent ofitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors, containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated G-protein coupled receptor polypeptide useful for identifying compounds that modulate the protein expression or activity which are used to treat a variety of physiological or mental disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAB47761-69 show novel G-protein coupled receptor (NGPCR) polypeptides. The NGPCR coding sequences are found on chromosome 3 at 3811.1 in the human genome. These NGPCR proteins show the presence of 7 conserved transmembrane domains which are interconnected by non-conserved hydrophilic loops. They are involved

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the polypeptide or antisense nucleic acid, thereby producing a modified plant, and selecting for a modified trail (e.g. increased production of agriculturally useful proteins or metabolic chemicals, pest tolorance, environmental stress response (e.g. drought), microbial disease resistance, herbicide resistance, seed and fruit yield, growth rate, leaf and flower senescence and many other traits listed in the specification). The present sequence is one of the 232 proteins which are a thallane transcription factors:
                   associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polynucleotides, a computer readable medium having stored sequence information, and identifying a homologue sequence from a database comprising a plurality of known plant sequences comprising inputting sequence information, and identifying an esquence specification in the specification. The isolated of fully defined sequences given in the specification. The isolated or recombinant polynucleotide is used for producing a plant having a modified trait, the method comprising selecting a polynucleotide that encodes a polypeptide or antisense nucleic acid, inserting the polynucleotide or antisense nucleic acid, into a expression vector, introducing the vector into a plant to a cell of a plant to overexpress the polypeptide or antisense nucleic acid, thereby producing a modified
ectopic expression or altered expression of one or more genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     microbial disease resistance; herbicide resistance; seed yie

The invention relates to 1 of 232 isolated or recombinant polynucleotides encoding an Arabidopsis thaliana transcription factor, tippir variants, complements, fragments, or related polynucleotide with 31% to 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered to a wholytype as compared to a wild-type or reference plant, or the plant exhibits and altered exhibits ectopic expression or altered expression of one or more genes associated with a plant tait as compared to a wild plant. Also included are a transgenic plant comprising the polynucleotides, a computer readable medium having stored sequence information, and identifying a homologue sequence from a database comprising a plurality of known plant sequences comprising inputting sequence information selected from one of recombinant polynucleotide is used for producing a plant having a recombinant polynucleotide is used for producing a plant having a modified trait, the method comprising selecting a polynucleotide that encodes a polypeptide, or an antisense nucleic acid, inserting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pest tolerance, environmental stress response (e.g. drought), microbial disease resistance, herbicide resistance, seed and fruit yield, growth rate, leaf and flower senescence and many other traits listed in the specification). The present sequence is one of the 232 proteins which are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oolynucleotide or antisense nucleic acid into an expression vector, introducing the vector into a plant or a cell of a plant to overexpress

Novel isolated G-protein coupled receptor polypeptide useful for identifying compounds that modulate the protein expression or activity which are used to treat a variety of physiological or mental disorders

Claim 6; Page 77; 85pp; English.

The sequences given in AAB47761-69 show novel G-protein coupled receptor (NGPCR), polypeptides. The NGPCR coding sequences are found on chromosome 3 at 3411.1 in the human genome. These NGPCR proteins show the presence of 7 conserved transmembrane domains which are interconnected by non-conserved hydrophilic loops. They are involved in signal transduction after ligand binding. These NGPCR's are expressed in human placenta, bone marrow, trachea, testis, liver and kidney cells.
